InsightCMS - Email Integration Documentation

Feature: One-Click Google OAuth & Manual SMTP Setup | **Date:** October 2026

---

1. Overview of Implementation

As per the architecture guidelines, the email integration has been implemented with two clear options for Company Admins:

- **Option 1: Connect with Google (Recommended - One Click):** Allows company admins to authenticate their Gmail account via Google OAuth 2.0 without typing passwords, hostnames, or ports. Emails are sent using the official Gmail API (*gmail.send* scope).
- **Option 2: Manual SMTP Setup:** Allows companies using other email providers (Outlook, custom domain, AWS SES) to manually specify SMTP Host, Port, TLS, and credentials.

2. Changes Made in Codebase

Component	File Path	Details
Python Packages	Installed via pip	google-auth-oauthlib, google-api-python-client, google-auth
Database Model	Apps/companies/models.py	Added fields: email_provider, google_email, google_refresh_token, google_access_token, google_token_expiry
Unified Email Service	Apps/common/email_service.py	Centralized send_company_email() service supporting both Gmail API and SMTP backends
OAuth Endpoints	Apps/accounts/views.py & urls.py	/integrations/google/connect/, /integrations/google/callback/, /integrations/google/disconnect/
Frontend UI	Apps/accounts/templates/.../manage_users.html	Redesigned Email tab with Google One-Click card (Recommended) and collapsible Manual SMTP form

3. How User Flow Works

1. **Access Settings:** Admin navigates to *Settings > Manage User Settings > Email Integration*.
2. **Google One-Click:** Admin clicks **Connect with Google**. The app opens Google Consent screen. Upon authorization, tokens are securely stored and the UI displays *Active: Connected as email@gmail.com* with Reconnect and Disconnect options.
3. **Sending Invitations:** When inviting team members (*Add New User*), the system dispatches invitation links using the connected Gmail account or custom SMTP.

4. Next Step: Google Cloud Console Configuration

To enable live Google login in production or local testing:

1. Create a project in Google Cloud Console & enable **Gmail API**.
2. Configure OAuth Consent Screen with scope: https://www.googleapis.com/auth/gmail.send.
3. Create Web Application OAuth 2.0 Credentials with redirect URI: http://127.0.0.1:8000/integrations/google/callback/.

4. Add GOOGLE_CLIENT_ID and GOOGLE_CLIENT_SECRET to your .env or settings.py.
